August 2010

CERTIFICATE OF AUTHORSHIP/ORIGINALITY

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged with the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Candidate

Mingjie Xue

ACKNOWLEDGMENT

First and foremost, I would like to express my deepest gratitude to my supervisor, A/Prof Kumbesan Sandrasegaran, who has given me great supports and valuable guidance throughout my research work in UTS. He gave me the opportunity to get involved into the research area of telecommunication and offered me valuable suggestions and criticisms with his profound knowledge and research experience.

I would like to extend my appreciation to Huda Adibah Mohd Ramli who has helped me to gain the fundamental knowledge within my research scope and given me many suggestions on my research.

I also would like to thank Riyaj Basukala and Rachod Patachaianand, who have given me a lot of comments to improve my research work.

I would like to thank my fellow officemates: Cheng-Chung Lin, Leijia Wu and Lu Chen, who have given me a lot of encouragement and made the office a very pleasant and comfortable place.

Finally, I would like to give grateful thank to my parents, Jianyou Xue and Lili Wu, who has given me the excellent support and encouragement to achieve the best education.

ABSTRACT

The third generation partnership project long term evolution (3GPP LTE) system is proposed as a new radio access technology in order to support high-speed data and multimedia traffic. The 3GPP LTE system has a flat radio access network architecture consisting of only one node, known as eNodeB, between user and core network. All radio resource management (RRM) functions are performed at the eNodeB. As one of the essential RRM functions, packet scheduling is responsible for the intelligent allocation of radio resources for active users. Since there is a diversity of the traffic types in wireless systems, active users may have different Quality of Service (QoS) requirements. In order to satisfy various QoS requirements and efficiently utilize the radio resources, a packet scheduler adopts a specific packet scheduling algorithm when making decisions. Several packet scheduling algorithms have been proposed in the literature.

The objective of this thesis is to evaluate the performance of the well-known and some recently proposed packet scheduling algorithms and identify the suitability of these algorithms in the downlink LTE system. The performance evaluation of packet scheduling algorithms based on both computer simulation and theoretical analysis is provided in this thesis.

The performance of packet scheduling algorithms is evaluated in three scenarios including 100% RT scenario, 100% NRT scenario and 50% RT and 50% NRT scenario under the downlink LTE simulation environment. The simulation results for well-known packet scheduling algorithms show that Maximum-Largest Weighted Delay First (M-LWDF) outperforms other algorithms in the 100% RT scenario, while Exponential/Proportional Fair (EXP/PF) is comparatively more suitable in the 50% RT and 50% NRT scenario. In the 100% NRT scenario, Proportional Fair (PF) and Maximum Rate (Max-Rate) achieve a good throughput and resource block (RB)

utilization performance while Round Robin (RR) has the best fairness performance. Additionally, two recently proposed algorithms are evaluated and can be considered as the packet scheduling candidates. The simulation results show that Sun Qiaoyun's Algorithm is more appropriate than Jeongsik Park's Algorithm for the downlink LTE supporting the real-time traffic.

The mathematical model for performance evaluation of the packet scheduling algorithms in the downlink LTE system is discussed in this thesis. The theoretical delay analysis for OFDMA system and the theoretical throughput analysis of PF algorithm is studied and validated in detail. This thesis moves further to theoretical performance analysis of M-LWDF and obtains the analytical result of the expected throughput of M-LWDF.
